Synapse AI Recommendation Engine

Vector-powered neural discovery system matching users with hyper-relevant digital assets.

Business Context & Problem

Standard keyword searches and rule-based recommendation tables fail when user intent is implicit or queries lack exact token matches.

Engineered Solution Blueprint

Designed an asynchronous inference architecture: user interactions trigger background embedding calculations, while vector similarity queries return nearest neighbors in millisecond windows.

384-Dimensional Vector Similarity Matrix & Neural Topology

Core Capabilities & Features

- **Semantic Similarity Matcher:** Transforms text queries and item metadata into high-dimensional vector representations.
- **Explainable AI Badges:** Displays transparent justification tags such as "Based on recent interest in Cloud Architecture".
- **Cold-Start Adaptive Onboarding:** Rapid user-preference calibration through a 3-step interactive preference selector.

Technology Stack

React, TypeScript, Python, FastAPI, PyTorch / Transformers, ChromaDB / Vector DB

Architecture Highlight

Microservice pipeline: React front-end connects via OpenAPI specs to FastAPI

Challenge: Preventing recommendation bubbles where the model repeatedly surfaces identical categories.
Solution: Incorporated a dynamic diversity entropy score that injects related but complementary adjacent topics.

06 • EXECUTION PLAYBOOK

Sprint-Driven Delivery Methodology

A transparent, milestone-gated engineering workflow ensuring zero-defect deployments and predictable schedules.

Sprint Phase	Core Focus & Activities	Primary Deliverables	Quality Gate
01 • Discover Sprint 01	**Business problem, goals & scope** We dive deep into your domain, dissect user friction points, and outline measurable functional specifications. No ambiguous assumptions.	Requirements specification, Architecture feasibility audit, Milestone roadmap	**Zero Ambiguity**
02 • Design Sprint 02	**User experience & technical blueprint** We map comprehensive user journeys, craft responsive wireframes, define design tokens, and model secure database schemas.	High-fidelity interactive prototype, System architecture diagram, API contract schema	**Pixel Precision**
03 • Develop Sprints 03–05	**Clean, reliable, scalable engineering** Our engineers write strongly typed, tested, and modular code with modern best practices, continuous commits, and iterative sprint reviews.	Component-driven frontend, Hardened backend APIs, CI/CD pipeline integration	**100% Type-Safe**
04 • Test Sprint 06	**Functionality, security & speed validation** Rigorous cross-browser verification, responsive stress-testing, automated API regressions, and Core Web Vitals optimization.	Cross-platform QA audit, Security & vulnerability review, Lighthouse 95+ performance check	**Enterprise Secure**
05 • Deliver Release	**Production launch & ongoing stability** Seamless deployment to production cloud infrastructure with zero downtime, telemetry alarms, and post-launch maintenance.	Production cloud release, Comprehensive handover docs, Real-time uptime monitoring	**99.99% Uptime**

Client Involvement & Governance Commitments

1. **Weekly Sprint Demos:** Working software demonstrated in staging environments every 2 weeks.
2. **Direct Git / Slack Access:** Transparent commits, direct developer channels, and zero intermediary delay.
3. **Documented Architecture:** Full API schemas, database ERDs, and deployment runbooks handed over upon completion.
